

Spray application heads

schütze
SPRAYTECHNOLOGY

The spray application heads are mostly used for surface-coating for larger components. The spray application heads are adapted to the customer's individual needs with multiple modules.

Different hole gauges can be produced between the nozzles. The number of modules is variable. The total width of the application heads is also variable. The modules on the spray application head can be activated jointly, in defined groupings or individually.

The base body can be equipped with heating elements so that even heated media can be applied. Different nozzles and air caps allow for individual adjustment to the tasks in hand. The spray application heads are always adapted to the given demands and thus must be designed individually.

Special designs on request.
