

Material Distributor

schütze
SPRAYTECHNOLOGY

The SCHÜTZE material distributors are designed for the distribution of material (supplied from a pump or a pressure tank) to several spray/extrusion valves or guns.

These distributors are manufactured from stainless steel. In this way they are suitable for most fluids f.i. glues, adhesives, colours, paints, release agents, oils...

Different connections for various hoses are available. Also there is the possibility to use shut-off valves to block single outputs.

Different pressure ranges are possible. A high pressure version for pressures up to 170 bar is also available.

By default versions with 4, 6 or 8 outputs are available.

Special designs on request.
Technical alterations reserved.
